Unit #3: Differential Equations *Topic:* Separable Differential Equations *Objective: SWBAT find a general solution to a separable differential equation.*

Warm Up #1:

Find the particular solution to the equation $\frac{d^2y}{dx^2} = 2x + 1$ when x = 0,

 $\frac{dy}{dx} = -1, \text{ and } y = 3.$

A differential equation is an equation which contains a derivative such as $\frac{dy}{dx}$. A differential equation can be solved by finding an expression for *y* in terms of *x* without the derivative.

What if there is more than one variable?

A differential equation of the form $\frac{dy}{dx} = f(y)g(x)$ is called a **separable differential** equation if it can be solved by **separating the variables** and then antidifferentiating each side with respect to the given variable.

Example #1: Find the general solution for the following equation $\frac{dy}{dx} = \frac{(x^2+1)}{2y}$

Example #2: Solve the equation $\frac{dy}{dx} = e^{x-y}$ to find the general solution.

Problem Set #1: Find the general solution to each of the following differential equations.
